

Stochastic processes: Measuring diffusion

— Lanzhou, 3rd August 2018 —

The bromine experiment

Relaxation processes

Deborah number:

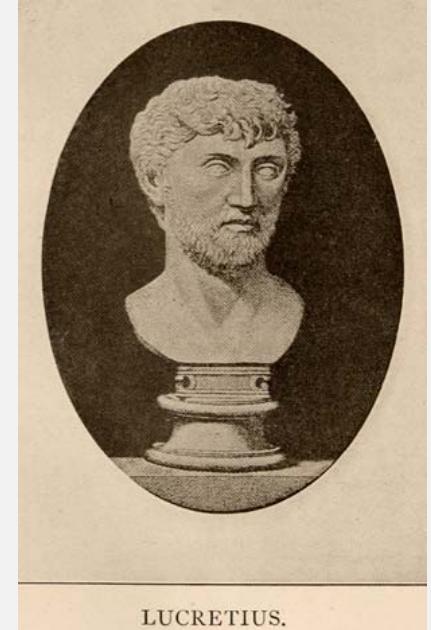

$$\text{De} = \frac{\text{Relaxation time scale}}{\text{Experimental time}}$$

The tar pitch drop experiment (U Queensland):

Date	Event
1927	Setup experiment
1930	Stem cut
12/1938	1st drop fell
02/1947	2nd drop fell
04/1954	3rd drop fell
05/1962	4th drop fell
08/1970	5th drop fell
04/1979	6th drop fell
07/1988	7th drop fell
11/2000	8th drop fell

*. . . for behold whenever
The sun's light and the rays, let in, pour down
Across dark halls of houses: thou wilt see
The many mites in many a manner mixed
Amid a void in the very light of the rays,
And battling on, as in eternal strife,
And in battalions contending without halt,
In meetings, partings, harried up and down.*

LUCRETIUS.

*Laß in ein dunkles Zimmer einmal die Strahlen der Sonne
Fallen durch irgendein Loch und betrachte dann näher den Lichtstrahl:
Du wirst dann in dem Strahl unzählige, winzige Stäubchen
Wimmeln sehn, die im Leeren sich mannigfach kreuzend vermischen,
Die wie in ewigem Kriege sich Schlachten und Kämpfe zu liefern
Rottenweise bemühen und keinen Moment sich verschnaufen.
Immer erregt sie der Drang zur Trennung wie zur Verbindung.*

On the Nature of Things, Titus Lucretius Carus (50 BCE)

Dutch physician Jan Ingenhousz 1785

Described the jittery motion of coal dust on an alcohol surface

This plant was *Clarkia pulchella*, of which the grains of pollen, taken from antherae full grown, but before bursting, were filled with particles or granules of unusually large size, varying from nearly 1/4000th to 1/5000th of an inch in length, and of a figure between cylindrical and oblong, perhaps slightly flattened, and having rounded and equal extremities. While examining the form of these particles immersed in water, I observed many of them very evidently in motion; their motion consisting not only of a change of place in the fluid, manifested by alterations in their relative positions, but also not unfrequently of a change of form in the particle itself; a contraction or curvature taking place repeatedly about the middle of one side, accompanied by a corresponding swelling or convexity on the opposite side of the particle. In a few instances the particle was seen to turn on its longer axis. These motions were such as to satisfy me, after frequently repeated observation, that they arose neither from currents in the fluid, nor from its gradual evaporation, but belonged to the particle itself.—1828

Microscopical observations

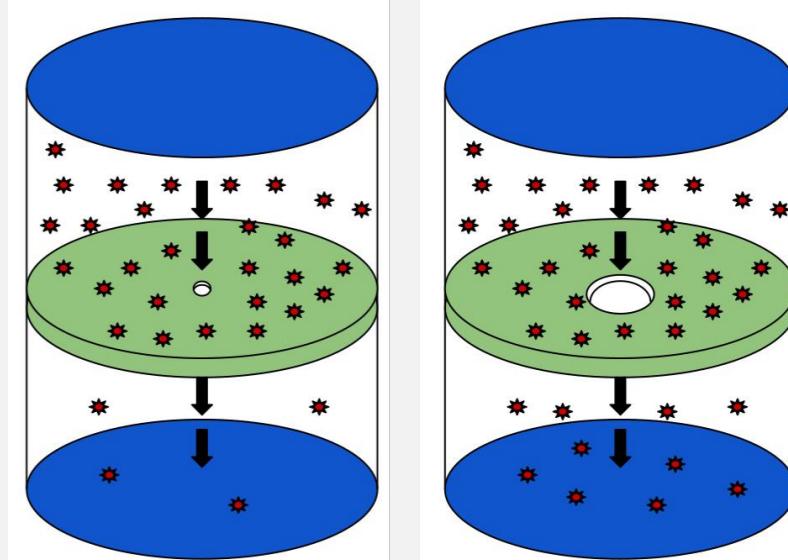

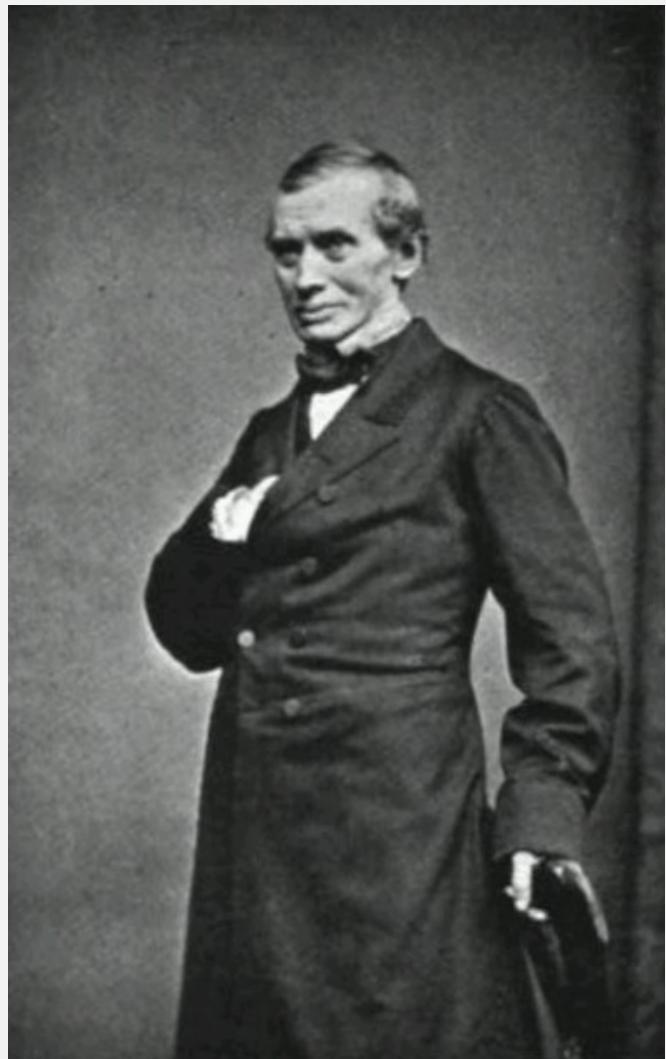

on the particles contained in the pollen of plants; and on the general existence of active molecules in organic and inorganic bodies

Rocks of all ages, including those in which organic remains have never been found, yielded the molecules in abundance. Their existence was ascertained in each of the constituent molecules of granite, a fragment of the Sphinx being one of the specimens examined.

Scottish chemist Thomas Graham 1846

Formulates a law of effusion of gases

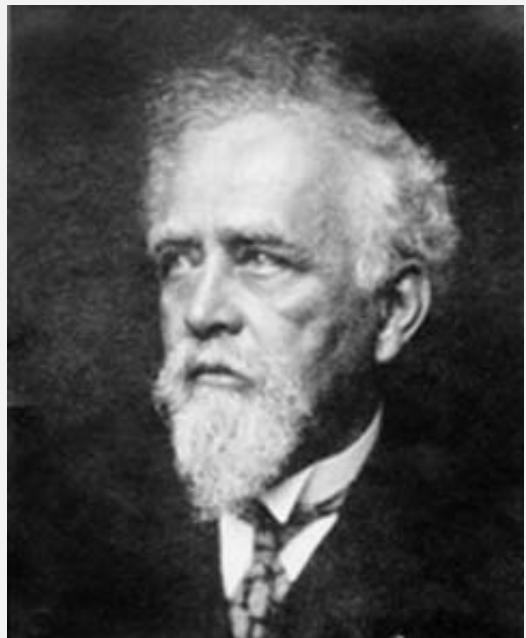

Effusion (left) vs diffusion (right)

Graham's law:

$$\frac{\text{Rate of effusion of gas 1}}{\text{Rate of effusion of gas 2}} = \sqrt{\frac{M_2}{M_1}}$$

M_i : molecular mass

Anomalous diffusion, ensemble & time averaged MSD

Ensemble averaged MSD (subdiffusion: $0 < \alpha < 1$; superdiffusion: $1 < \alpha < 2$):

$$\langle \mathbf{r}^2(t) \rangle = \int \mathbf{r}^2 P(\mathbf{r}, t) d\mathbf{r} \simeq K_\alpha t^\alpha$$

E Kappler (1931)

Time averaged MSD:

$$\overline{\delta^2(\Delta)} = \frac{1}{T - \Delta} \int_0^{T-\Delta} [\mathbf{r}(t + \Delta) - \mathbf{r}(t)]^2 dt; \quad \left\langle \overline{\delta^2(\Delta)} \right\rangle = N^{-1} \sum_{i=1}^N \overline{\delta_i^2(\Delta)}$$

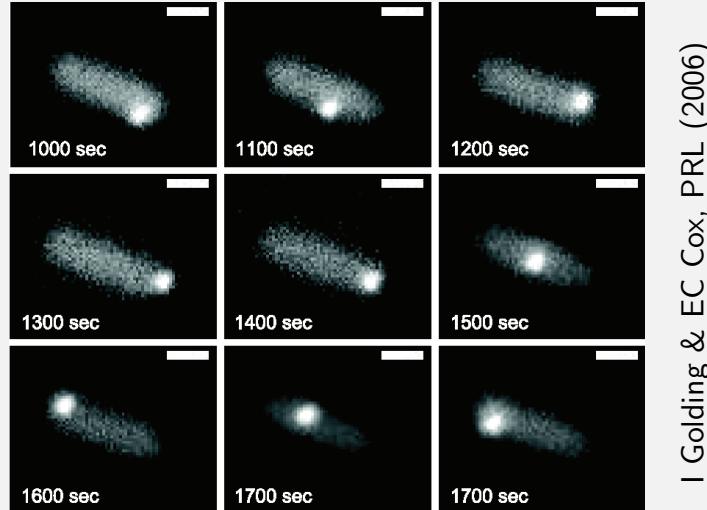

Ergodicity:

$$\langle \mathbf{r}^2(\Delta) \rangle = \lim_{T \rightarrow \infty} \overline{\delta^2(\Delta)}$$

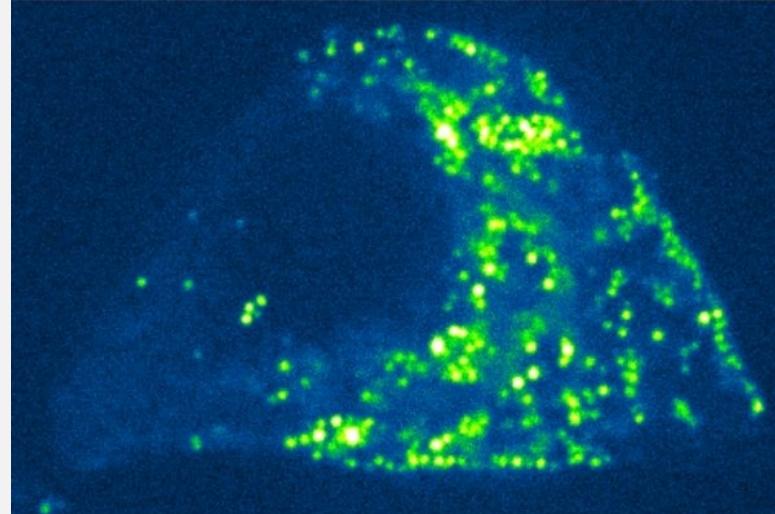

Ergodicity breaking parameter: $EB = \langle \xi^2 \rangle - 1$ with $\xi = \overline{\delta^2(\Delta)} / \left\langle \overline{\delta^2(\Delta)} \right\rangle$

Brownian motion: $EB \simeq (\Delta/T)$

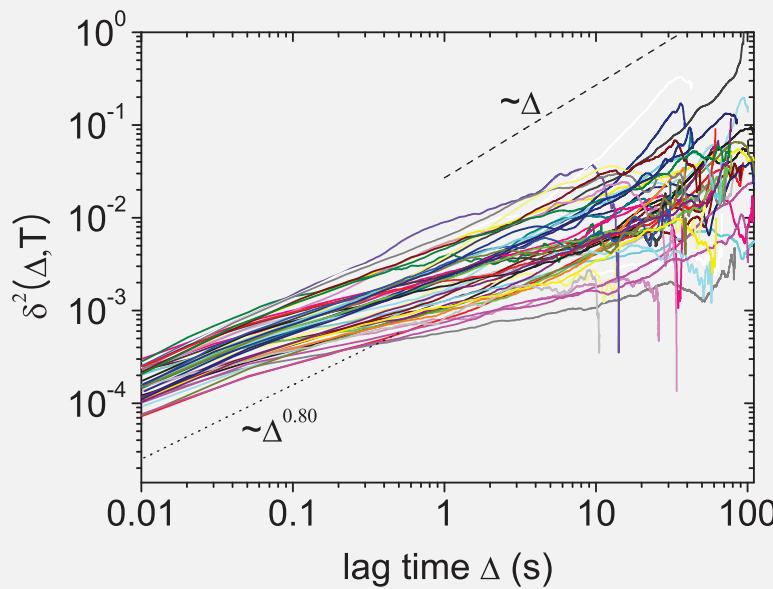

In vivo anomalous diffusion of submicron tracers: $\langle \mathbf{r}^2(t) \rangle \simeq t^\alpha$
